

# PANCREAS

## Thyroid-Adrenal-Pancreas Axis

CELLS: Alpha-Cells, Islets of Langerhans	CELLS: Beta-Cells, Islets of Langerhans	CELLS: D-Cells, Islets of Langerhans	CELLS: F/D1-Cells/PP-Cells, Islets of Langerhans
<b>SECRETION:</b> Glucagon	<b>SECRETION:</b> Insulin	<b>SECRETION:</b> Somatostatin, SS-14.	<b>SECRETION:</b> Pancreatic polypeptide.
<b>STIMULATED BY:</b> Δ [blood glucose]. The concentration of blood glucose falls below normal range. Promoted by sympathetic nervous system.	<b>STIMULATED BY:</b> Δ [blood glucose]. The concentration of blood glucose rises above normal range. Promoted by parasympathetic nervous system. Indirectly by growth hormone and adrenocorticotrophic hormone.	<b>STIMULATED BY:</b> Δ [blood glucose]. High blood glucose levels and amino acids. Food intake. Changes in other pancreatic hormone levels.	<b>STIMULATED BY:</b> Parasympathetic vagal cholinergic innervation. Food intake proportional to caloric consumption.
<b>TARGETS:</b> Primarily skeletal muscles and liver.	<b>TARGETS:</b> The plasma membranes of almost all cells except: neurons and red blood cells; epithelial cells of kidney tubules; epithelial cells of intestinal lining.	<b>TARGETS:</b> SS-14 form targets nervous system and pancreas.	<b>TARGETS:</b> Mainly digestive organs.
<b>EFFECTS:</b> <ul style="list-style-type: none"> <li>Skeletal muscles and liver break down glycogen into glucose.</li> <li>Regulation of carbohydrate, protein, lipid metabolism.</li> <li>Adipose tissues release fatty acids; proteins are broken down into amino acids. Catabolic.</li> </ul>	<b>EFFECTS:</b> <ul style="list-style-type: none"> <li>Promotes glucose transport into cells and cell metabolism of glucose.</li> <li>Promotes ATP synthesis.</li> <li>Increase cellular energy reserves.</li> <li>Increase protein synthesis rates.</li> <li>Increase amino acid transport across plasma membrane.</li> <li>Stimulate fat cells to increase triglyceride synthesis/storage.</li> <li>Promotes glycogen formation in liver/muscles.</li> <li>Promotes growth, glycogen storage, increased fat reserves.</li> </ul>	<b>EFFECTS:</b> <ul style="list-style-type: none"> <li>Inhibits secretion of other pancreatic hormones like glucagon and insulin. Paracrine.</li> <li>Inhibits secretion of other hormones.</li> <li>Suppress pancreatic exocrine secretions by inhibiting cholecystokinin-stimulated enzyme secretion and secretin-stimulated bicarbonate secretion.</li> <li>Neurotransmission.</li> <li>Neuromodulatory activity.</li> </ul>	<b>EFFECTS:</b> <ul style="list-style-type: none"> <li>Anorectic peptide.</li> <li>Promotes satiety.</li> <li>Promotes gastric emptying.</li> <li>Promotes gall bladder contraction.</li> <li>Promotes pancreatic exocrine function.</li> <li>Decreases corticotrophin-releasing factor.</li> <li>Biomarker for ectopic fat deposition.</li> </ul>
